The EIMAC 8020 diode is a high-vacuum rectifier intended for use in rectifier units, voltage multipliers, or in special applications, whenever conditions of extreme ambient temperatures, high operating frequency, high peak inverse voltages, or the production of high-frequency transients would prevent the use of gas-filled rectifier tubes.

The 8020 has a maximum dc current rating of 100 milliamperes and a maximum peak inverse voltage rating of 40,000 volts. Cooling is by convection and radiation.

A single 8020 will deliver 80 milliamperes at 17,000 volts to a capacitor-input filter with 14,000 volts single-phase supply. Four 8020's in a bridge circuit will deliver 200 milliamperes at 25,000 volts to a choke-input filter with 28,000 volts single-phase supply.

**GENERAL CHARACTERISTICS**

**ELECTRICAL**
- Filament: Thoriated Tungsten
- Voltage: 5.0 volts
- Current: 6.5 amperes

**MECHANICAL**
- Base: Medium 4-pin bayonet
- Basing: Refer to outline drawing
- Socket: Refer to discussion under “Application”
- Mounting Position: Vertical, base down or up
- Cooling: Convection and radiation
- Maximum Temperature of Plate Seal: 225°C
- Recommended Heat Dissipating Plate Connector: EIMAC HR-8
- Maximum Overall Dimensions:
  - Length: 8.00 inches
  - Diameter: 2.32 inches
- Net Weight: 4 ounces
- Shipping Weight (approx.): 1 pound

**MAXIMUM RATINGS (Per Tube)**
- Peak Inverse Plate Voltage: 40,000 volts
- Plate Dissipation: 60 watts
- DC Plate Current: 100 ma
- Peak Plate Current: 1.5 ampere

1 Averaged over one cycle for each tube. Applies only when the rectifier is coupled to the load by a choke-input filter incorporating the “critical” value (or larger) of input inductance. For maximum dc current ratings under this and other load conditions see discussion under “Application.”

**APPLICATION**

*Mounting*—The 8020 must be mounted vertically with the base either down or up. The lead to the plate terminal of the tube should be flexible.

The medium 4-pin bayonet base fits an E. F. Johnson Co. No. 122-124, a National Co. No. XC-4 or GIR-4, or an equivalent socket. In some circuits, particularly those of the voltage multipliers illustrated in Fig. 2, it may be necessary to mount the socket on stand-off insulators, or on a sheet of insulating material, to provide adequate insulation to ground.

*Cooling*—The 8020 is cooled by convection and radiation. Clearance should be provided around the glass envelope adequate for free circulation of air. An EIMAC HR-8 Heat Dissipating Connector or equivalent is required on the plate terminal.

APPLICATION (Continued)

The maximum temperature at the plate seal must not exceed 325°C. A convenient accessory for measuring this temperature is “Templag,” a temperature-sensitive lacquer available from the Templag Corporation, 132 W. 22nd St., New York 11, N. Y.

ELECTRICAL

Filament Operation—For maximum tube life, the filament voltage, as measured at the base pins, should be the rated value of 5.0 volts. Variations must be kept within the range from 4.75 to 5.25 volts. In applications which require the diode to deliver high peak currents, it is important to maintain the filament voltage at the rated value.

Caution should be observed when measuring rectifier filament voltage. The filament circuit may be at high potential.

The thoriated-tungsten filament of the 8020 reaches operating temperature in a fraction of a second after application of voltage. Plate voltage may be applied simultaneously with filament voltage.

Plate Operation—With low room illumination, the plate of the 8020 begins to show color as the maximum plate dissipation rating of 60 watts is approached. The maximum peak inverse voltage rating of 40,000 volts should not be exceeded at any time.

Performance—The accompanying table shows some maximum performance capabilities of the 8020 when used as a power-supply rectifier.

1 One-half the transformer secondary voltage.

Maximum DC Current Ratings—Plate dissipation rather than peak current usually limits the dc current which the 8020 is capable of delivering to the load. Because the plate dissipation associated with a given dc current depends upon the amount of ripple and its wave-shape, circuit conditions will determine the maximum dc current rating of the tube.

Choke-Input Filter—The maximum dc current rating of the 8020 is 100 milliamperes when the load incorporates a choke-input filter with the “critical” value (or larger) of input inductance (L in Fig. 1):

\[ L_o = \frac{R_{eff}}{18.6f} \]

for full-wave single-phase rectifiers,

\[ L_o = \frac{R_{eff}}{75f} \]

for half-wave three-phase rectifiers,

\[ L_o = \frac{R_{eff}}{660f} \]

for full-wave three-phase rectifiers,

where: \( L_o \) = “critical” value of input inductance (henries), \( f \) = supply-line frequency (cycles per second), \( R_{eff} \) = load voltage (volts), \( R_{eff} \) = load current (amps).

Choke-input filters are not normally used with single-phase half-wave rectifiers.

Capacitor-Input Filter—The 8020 is particularly suitable for power-supply applications demanding high voltage at low current. Under these conditions capacitor-input filter circuits become desirable. The maximum dc current rating of the 8020 when no input choke is incorporated in the filter depends upon the total series resistance of the capacitor-charging circuit relative to the effective load resistance seen by each tube. The circuit diagrams and tabulation in Fig. 2 are so arranged and labeled that this required series resistance may be found for a wide range of load conditions. This may be done by determining the value of the following quantities:

\[ E_o \] = the filter-input dc voltage. While this is usually the entire load voltage, in the case of voltage multipliers it is the load voltage divided by the multiplication factor.

\[ I_p \] = the dc current per tube. This is the entire load current only in the case of the simple half-wave rectifier or half- or full-wave multiplier. In the case of full-wave center-tapped or bridge rectifiers, \( I_p \) is half the load current.

\[ R_p \] = the total charging-circuit resistance. A certain minimum value of charging-circuit resistance is necessary to limit the peak value of current to which the tubes will be subjected under given load conditions. This required minimum depends upon the dc current per tube (\( I_p \)), and has been tabulated in Fig. 2 as a percentage of the effective load resistance per tube \( \left( \frac{E_o}{I_p} \right) \). The total charging circuit resistance involves the internal resistance of the rectifier tube, \( R_p \), the added series resistor, \( R_s \), and the equivalent internal resistance of the ac voltage supply, \( R_s \).

\[ R_p \] is the plate resistance of the 8020, which may be taken as 1000 ohms.

\[ R_s \] is the equivalent internal resistance of the supply. This may be taken as the regulation of the high-voltage supply expressed as a decimal multiplied by the load resistance used in measuring this regulation.

\[ R_s \] is the series resistor which must be inserted in the charging circuit to bring the total charging-circuit resistance up to the required minimum. Its value may be found from the formula associated with each of the circuits of Fig. 2. This resistor must be inserted in such a position in the circuit that it protects all tubes.

Tubes may be operated in parallel to increase the output capability in a given circuit. When two tubes are placed in parallel at each place where one is shown in the circuits of Fig. 2, the plate resistance (\( R_p \)) will be half as great and the maximum allowable load current twice as great as indicated.

Peak Inverse Voltage—The peak inverse voltage rating of the 8020 is 40,000 volts. In single-phase power-supply rectifier circuits the peak inverse voltage to be used in design is the peak ac supply voltage (1.41 times \( E_{rms} \) in Fig. 2) in the case of bridge circuits, and twice this value in the case of half- or full-wave rectifiers and voltage multipliers. Peak inverse voltage in three-phase operation depends upon the circuit employed, and will be found listed in the handbooks.

Special Applications—The ratings given for capacitor-input filter circuits assume values of input capacitance large enough to hold the ripple to a low value. In special applications where a large percent ripple is tolerable and filter capacitance is low, the 8020 is capable of larger dc output currents.

As a unidirectional conductor in dc circuits where the current is continuous and the percent ripple is moderate, the maximum current rating of the 8020 is 200 milliamperes.

The plate characteristic curve for the 8020 serves as a guide to special applications. The maximum plate dissipation rating of 60 watts, the maximum peak inverse voltage rating of 40,000 volts, and the maximum peak plate current of 1.5 amperes must not be exceeded.
