The AmpereX 8108 is a disc seal triode designed for use as a CW amplifier, oscillator, frequency doubler or frequency tripler to frequencies over 6000 Mc/sec. The 8108 delivers a saturation power of more than 2 watts with an operating voltage of only 180 volts. Amplifier gain of 19 db or more can be achieved. In suitable cavity circuits the 8108 can operate at full power with sink cooling or free-air convection cooling. Life expectancy is 10,000 hours.

GENERAL CHARACTERISTICS

- Grid
- Cathode

Accessories
Torque Wrench

ELECTRICAL

Heater Voltage
6.3 volts ac or dc parallel supply

Heater Current
0.735 amps

Direct Interelectrode Capacitances
- Anode to Grid
- Anode to Cathode
- Grid to Cathode

Anode Voltage
- Apaede Current
- Negative Grid Voltage
- Transconductance
- Amplification Factor

1 Special attention should be paid to the mounting of the tube in those cases where it is used in portable equipment. Shocks, especially in a direction perpendicular to the axis of the tube should be avoided.

2 The tube should be screwed into the circuit by means of a key with a torque within the limits specified. The key should fit in the notches of the tube base, the pins of the base being left free. See Accessories.

3 A low velocity air flow may be necessary. The equipment designer is cautioned that differential cooling of one side of the cathode grid or grid anode glass either by use of excessive cooling air directed from one side or by poorly dispersed cooling air can result in damage to the glass and loss of the tube.

4 Measured with 6.3 volts on the heater under conditions where no cathode current is drawn.

from JEDEC release #4524, Dec. 9, 1963,
and release #4524A, April 6, 1964
MAXIMUM RATINGS, ABSOLUTE VALUES

- Anode Voltage (Cut-Off Condition) 500 volts
- Anode Voltage 300 volts
- Anode Dissipation 125 watts
- Negative Grid Voltage 50 volts
- Positive Grid Voltage 5 volts
- Grid Current 10 ma
- Grid Dissipation 200 milliwatts
- Grid Input Power (f = 4000 Mc) (Grounded Grid Circuit)
  - Cathode Current 1 watt
  - Cathode-Heater Voltage 70 ma
  - Heater Voltage 50 volts
  - Peak Negative Grid Voltage 6.4 ± 2% volts
  - Peak Positive Grid Voltage 100 volts
  - 20 volts

MAXIMUM CIRCUIT VALUES

- External Cathode-Heater Resistance 20,000 ohms
- External Grid Lead Resistor 3,000 ohms

TYPICAL CHARACTERISTICS AS AMPLIFIER (Frequency = 4000 Mc)

- Anode Supply Voltage, $E_{bb}$ (See Figure 1) 200 200 volts
- Grid Supply Voltage, $E_{cc}$ (See Figure 1) +20 +20 volts
- Cathode Resistor 60 30 ma
- Anode Current 50 50 Mc
- Bandwidth 7 1.8 -- watts
- Power Output (Power Gain = 8 db)
  - Typical 1.5 -- watts
  - Minimum
- Power Output (Power Gain = 6 db)
  - Typical -- 0.9 watt
  - Minimum -- 0.35 watt
- Power Gain (Power Input = 1 mw)
  - Typical 13 13 db
  - Minimum 10 10 db

---

6 This value can be multiplied by the dc inverse feedback factor to a maximum of 25,000 ohms.

7 A variable resistor of 500 ohms maximum (at an anode current of 60 ma) or 1000 ohms maximum (at an anode current of 30 ma) is to be used. It should be adjusted for the desired anode current. See Figure 1.

7 The quoted value is the bandwidth between the 0.1 db points of the flattened response curve. See Figure 2.

Note 1: The eccentricities are given with respect to the axis of the threaded hole (see Figure 4) in which the tube is screwed firmly against the flange, the inner diameter of which is 0.709 inches.

Note 2: Eccentricity of the axis of the anode = 0.006 inches maximum.

Note 3: Eccentricity of the axis of the cathode = 0.008 inches maximum.

Note 4: The tolerance of the eccentricity of the axis of the base is such, that this base fits into a hole with a diameter of 1.280 inches, provided this hole is correctly centered with respect to the axis of the hole of Figure 4.

Note 5: The tolerance of the eccentricity of the axis of the base flange is such, that this flange fits into a hole with a diameter of 1.319 inches, provided this hole is correctly centered with respect to the axis of the hole of Figure 4.
